

Amendment to the Specification:

Please delete the paragraph on page 6, lines 10-24 and replace the same with the following amended paragraph.

A particular implementation of the invention relates to the usage of a content identifier, referred to as a CRID (Content Reference ID), which has been introduced into the TV-Anytime concept. The TV-Anytime forum aims to specify a set of industry-wide standards for Digital Video Recorders (DVRs), also referred to as Personal Video Recorders (PVRs). A PVR is a video recorder with, e.g., a hard disk (HD) for video storage. Phase One of TV-Anytime enables audio and video search, capture and playback of content. It also enables segmentation and indexing of that content. Phase Two will specify open standards that build on the foundations of Phase One specifications and will include areas such as targeting, redistribution and new content types. Content redistribution includes moving content around among devices and systems. Examples of redistribution are, e.g., content sharing, home networking and removable media. Content sharing is the P2P distribution of content over provider networks. Home networking relates to the sharing of content among multiple storage devices and display terminals within a defined private physical network. Removable media can be involved in the redistribution of content on physical storage such as optical discs, flash cards, etc. (i.e., a non-transitory, computer readable medium).
